

EUROPEAN STANDARD  
NORME EUROPÉENNE  
EUROPÄISCHE NORM

EN 1092-1

April 2018

ICS 23.040.60

Supersedes EN 1092-1:2007+A1:2013

English Version

Flanges and their joints - Circular flanges for pipes, valves,  
fittings and accessories, PN designated - Part 1: Steel  
flanges

Brides et leurs assemblages - Brides circulaires pour  
tubes, appareils de robinetterie, raccords et  
accessoires, désignées PN - Partie 1: Brides en acier

Flansche und ihre Verbindungen - Runde Flansche für  
Rohre, Armaturen, Formstücke und Zubehörteile, nach  
PN bezeichnet - Teil 1: Stahlflansche

This European Standard was approved by CEN on 27 November 2017.

CEN members are bound to comply with the CEN/CENELEC Internal Regulations which stipulate the conditions for giving this European Standard the status of a national standard without any alteration. Up-to-date lists and bibliographical references concerning such national standards may be obtained on application to the CEN-CENELEC Management Centre or to any CEN member.

This European Standard exists in three official versions (English, French, German). A version in any other language made by translation under the responsibility of a CEN member into its own language and notified to the CEN-CENELEC Management Centre has the same status as the official versions.

CEN members are the national standards bodies of Austria, Belgium, Bulgaria, Croatia, Cyprus, Czech Republic, Denmark, Estonia, Finland, Former Yugoslav Republic of Macedonia, France, Germany, Greece, Hungary, Iceland, Ireland, Italy, Latvia, Lithuania, Luxembourg, Malta, Netherlands, Norway, Poland, Portugal, Romania, Serbia, Slovakia, Slovenia, Spain, Sweden, Switzerland, Turkey and United Kingdom.

## European foreword

This document (EN 1092-1:2018) has been prepared by Technical Committee CEN/TC 74 "Flanges and their joints", the secretariat of which is held by DIN.

This European Standard shall be given the status of a national standard, either by publication of an identical text or by endorsement, at the latest by October 2018 and conflicting national standards shall be withdrawn at the latest by October 2018.

Attention is drawn to the possibility that some of the elements of this document may be the subject of patent rights. CEN shall not be held responsible for identifying any or all such patent rights.

This document supersedes EN 1092-1:2007+A1:2013.

This document has been prepared under a mandate given to CEN by the European Commission and the European Free Trade Association, and supports essential requirements of EU Directive 2014/68/EU.

For relationship with EU Directive(s), see informative Annex ZA, which is an integral part of this document.

The major changes in comparison with EN 1092-1:2007+A1:2013 include:

- a) standard references were updated;
- b) several changes were made in some synoptic tables;
- c) changes were implemented in thicknesses for types 36 and 37;
- d) flanges Type 5 for PN 160 to PN 400 were implemented.

EN 1092, *Flanges and their joints — Circular flanges for pipes, valves, fittings and accessories, PN designated*, consists of the following four parts:

- Part 1: Steel flanges;
- Part 2: Cast iron flanges;
- Part 3: Copper alloy flanges;
- Part 4: Aluminium alloy flanges.

According to the CEN-CENELEC Internal Regulations, the national standards organizations of the following countries are bound to implement this European Standard: Austria, Belgium, Bulgaria, Croatia, Cyprus, Czech Republic, Denmark, Estonia, Finland, Former Yugoslav Republic of Macedonia, France, Germany, Greece, Hungary, Iceland, Ireland, Italy, Latvia, Lithuania, Luxembourg, Malta, Netherlands, Norway, Poland, Portugal, Romania, Serbia, Slovakia, Slovenia, Spain, Sweden, Switzerland, Turkey and the United Kingdom.

## Introduction

When the Technical Committee CEN/TC 74 started its work of producing this European Standard, it took as its basis the International Standard ISO 7005-1, Steel flanges.

In taking this decision, CEN/TC 74, agreed that this standard would differ significantly from the ISO standard in respect of the following:

- a) whereas ISO 7005-1 included in its scope both the original DIN based flanges and also the original ANSI/ASME based flanges, EN 1092-1 contains only the PN based flanges. CEN/TC 74 has produced a separate series of standards, EN 1759-1, EN 1759-3 and EN 1759-4, dealing with the ANSI/ASME based flanges in their original Class designations;
- b) the opportunity was taken to revise some of the technical requirements applicable to the DIN origin flanges.

Consequently, while the mating dimensions, the flange and facing types and designations are compatible with those given in ISO 7005-1, it is important to take account of the following differences which exist in EN 1092-1:

- 1) the p/T ratings of this standard have been reduced in many cases by either limiting the lower temperature ratings which can no longer exceed the PN value, or by increasing the rate at which allowable pressures shall reduce with increase in temperature;
- 2) in addition to the range of PN 2,5 to PN 40 DIN origin flanges contained in the ISO standard, EN 1092-1 also includes flanges up to PN 400.

## 1 Scope

This European Standard for a single series of flanges specifies requirements for circular steel flanges in PN designations PN 2,5 to PN 400 and nominal sizes from DN 10 to DN 4000.

This European Standard specifies the flange types and their facings, dimensions, tolerances, threading, bolt sizes, flange jointing face surface finish, marking, materials, pressure/ temperature ratings and approximate flange masses.

For the purpose of this European Standard, "flanges" include also lapped ends and collars.

This European Standard applies to flanges manufactured in accordance with the methods described in Table 1.

Non-gasketed pipe joints are outside the scope of this European Standard.

## 2 Normative references

The following documents, in whole or in part, are normatively referenced in this document and are indispensable for its application. For dated references, only the edition cited applies. For undated references, the latest edition of the referenced document (including any amendments) applies.

EN 1514-1:1997, *Flanges and their joints - Dimensions of gaskets for PN-designated flanges - Part 1: Non-metallic flat gaskets with or without inserts*

EN 1514-2:2014, *Flanges and their joints - Gaskets for PN-designated flanges - Part 2: Spiral wound gaskets for use with steel flanges*

ISO 7-1:1994, *Pipe threads where pressure-tight joints are made on the threads - Part 1: Dimensions, tolerances and designation*

ISO 4200:1991, *Plain end steel tubes, welded and seamless - General tables of dimensions and masses per unit length*

### **3 Terms and definitions**

For the purposes of this document, the following terms and definitions apply.

#### **3.1**

##### **DN**

alphanumeric designation of size for components of a pipework system, which is used for reference purposes and which comprises the letters DN followed by a dimensionless whole number that is indirectly related to the physical size, in millimetres, of the bore or outside diameter of the end connections

Note 1 to entry: The number following the letters DN does not represent a measurable value and should not be used for calculation purposes except where specified in the relevant standard.

Note 2 to entry: In those standards which use the DN designation system, any relationship between DN and component dimensions should be given, e.g. DN/OD or DN>ID.

[SOURCE: EN ISO 6708:1995, 2.1]

#### **3.2**

##### **PN**

alphanumeric designation which is used for reference purposes related to a combination of mechanical and dimensional characteristics of a component of a pipework system and which comprises the letters PN followed by a dimensionless number

Note 1 to entry: The number following the letters PN does not represent a measurable value and should not be used for calculation purposes except where specified in the relevant standard.

Note 2 to entry: The designation PN is not meaningful unless it is related to the relevant component standard number.

Note 3 to entry: The maximum allowable pressure of a pipework component depends on the PN number, the material and the design of the component, its maximum allowable temperature, etc. The relevant European Component standards include tables of specified pressure/temperature ratings or, in minimum, include rules how to determine pressure/temperature ratings.

Note 4 to entry: It is intended that all components with the same PN and DN designations have the same mating dimensions for compatible flange types.

[SOURCE: EN 1333:2006, 2.1]

**3.3****maximum allowable pressure****PS**

maximum pressure for which the equipment is designed, as specified by the equipment manufacturer

**3.4****maximum allowable temperature****TS**

maximum temperature for which the equipment is designed, as specified by the equipment manufacturer

**3.5****pressure equipment manufacturer**

any natural or legal person who manufactures pressure equipment or an assembly or has such equipment or assembly designed or manufactured, and markets that pressure equipment or assembly under his name or trademark or uses it for his own purposes

**3.6****flange manufacturer**

individual or organization that is responsible for the compliance of the flanges with the requirements of this European Standard

**3.7****purchaser**

person or organization that orders products in accordance with this European Standard

Note 1 to entry: The purchaser is not necessarily, but may be, a manufacturer of pressure equipment in accordance with the EU Directive listed in Annex ZA. Where a purchaser has responsibilities under this EU Directive, this European Standard will provide a presumption of conformity with the essential requirements of the Directive so identified in Annex ZA.

## **4 Designation**

### **4.1 General**

Table 6 specifies the flange types and collar types.

Figures 1 and 2 show flange types and collar types with the relevant flange type numbers. Flanges shall be denoted with "flange type" and the "flange description". Collar components shall be denoted with collar type and the collar description.

Figure 3 shows flange facing types, which may be used with the flanges or components shown in Figures 1 and 2. Flange facings shall be denoted with "type" and the relevant symbol.

The range of DN, applicable to each flange type and collar and to each PN, shall be as given in Table 7, however not all dimensions are existing for each type.

### **4.2 Standard designation**

Flanges and collars in accordance with this standard shall be designated with the following:

- a) designation, e.g. flange, lapped end or collar;
- b) number of this European Standard, i.e. EN 1092-1;
- c) number of flange type or collar type in accordance with Figures 1 and 2;

- d) type of flange facing in accordance with Figure 3;
- e) DN (nominal size);
- f) bore diameter only if not according to this standard (for sizes greater than DN 600);
  - 1)  $B_1$  (only for types 01, 12 and 32);
  - 2)  $B_2$  (only for type 02);
  - 3)  $B_3$  (only for type 04);
- g) wall thickness  $S$  only if not according to this European Standard (only for types 11 and 34, 35, 36 and 37);
- h) bevelled wall thickness  $Sp$  if required (only for types 11 and 34 to 37, see Annex A);
- i) PN designation;
- j) for type 13 flanges type of thread ( $R_p$  or  $R_c$ );
- k) material and material standard (if necessary);
- l) any heat treatment required;
- m) type of material certificate, if required (see 5.13).

EXAMPLE 1 Designation of a flange type 11 with facing type B2 of nominal size DN 200, wall thickness 9 mm, PN 100, made of material P245GH:

Flange EN 1092-1/11/B2/DN 200 × 9/PN 100/P245GH

EXAMPLE 2 Designation of a flange type 01 of nominal size DN 800, with bore diameter  $B_1 = 818$  mm, PN 6, made of material P265GH:

Flange EN 1092-1/01/DN 800/818/PN 6/P265GH

EXAMPLE 3 Designation of a collar type 32 of nominal size DN 400, PN 10 and made of material P265GH:

Collar EN 1092-1/32/DN 400/PN 10/P265GH

EXAMPLE 4 Designation of a flange type 02 of nominal size DN 400, PN 10 and made of material 1.0425:

Flange EN 1092-1/02/DN 400/PN 10/1.0425

## 5 General requirements

### 5.1 Materials

#### 5.1.1 General

Flanges and collars to be used in pressure equipment shall be manufactured from materials fulfilling the essential safety requirements of pressure equipment European legislation. Materials specifications which meet the requirements for this European Standard are given in Table 9 (see also Annex D).

Collars type 35 to 37 shall only be manufactured of austenitic/austenitic ferritic steel.

The fabricated flange shall fulfil the mechanical properties of the material standard.

**WARNING** — The restrictions of the different material standards shall be followed.

**NOTE 1** The materials given in Table 9 (see also Annex D) are tabulated in material groups containing materials of similar chemical/mechanical properties and corrosion resistance in order to facilitate an equivalent application of materials in a group depending on pressure, temperature and fluid.

**NOTE 2** The materials of ancillary components (for example rings according to Annex H) are not within the scope of this European Standard.

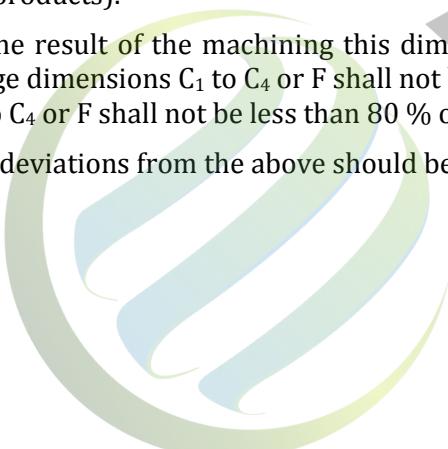

#### 5.1.2 Methods of manufacture related to base material

Methods of manufacture: see Table 1.

Mechanical properties are dependent from dimensions of unmachined parts („ $v_R$ “ for forgings, „ $t$ “ for flat products).

As the result of the machining these dimensions will be reduced. For machined flanges and collars the flange dimensions C<sub>1</sub> to C<sub>4</sub> or F shall not be less than 80 % of „ $v_R$ “ for forgings, and the flange dimensions C<sub>1</sub> to C<sub>4</sub> or F shall not be less than 80 % of t for flat products.

Any deviations from the above should be agreed between the manufacturer and purchaser.

www.wmonic.com

**Table 1 — Methods of manufacture**

Type of Flange and Collar	Forged <sup>a</sup>	Cast	Made from flat products (plates)	Machined from rolled or forged bars and forged sectional steel	Bent and electric welded from bars, sectional steel or strip <sup>b, c, d, e</sup>	Pressed from welded or seamless pipes or flat products
01 (Plate flange for welding)	yes	no	yes	yes	yes	no
02 (Loose plate flange for Types 32—37)	yes	no	yes	yes	yes	no
04 (Loose plate flange for Type 34)	yes	no	yes	yes	yes	no
05 (Blind flange)	yes	no	yes	yes	no	no
11 (Weld-neck flange)	yes	no	no	yes	yes, for $\geq$ DN 700	no
12 (Hubbed slip-on flange for welding)	yes	no	no	yes	no	no
13 (Hubbed threaded flange)	yes	no	no	yes	no	no
21 (Integral flange)	yes	yes	no	yes	no	no
32 (Weld-on plate collar)	yes	no	yes	yes	yes	no
33 (Lapped end pipe)	yes	no	yes	no	yes	yes
34 (Weld-neck collar)	yes	yes	no	yes	yes	no
35 (Welding neck)	yes	no	yes	yes	yes	no
36 (Pressed collar with long neck)	yes	no	no	no	yes	yes
37 (Pressed collar)	yes	no	yes	yes	yes	yes

<sup>a</sup> Seamless rolled, pressed, forged.

<sup>b</sup> Only one radial weld is allowed under DN 1800. If using cut strips for manufacturing, the through thickness direction of the strip for type 11 and 34 shall be perpendicular to the flange centerline, for Type 01, 02, 04 and 32 in the direction of the flange centreline.

<sup>c</sup> For welding: see 5.11.

<sup>d</sup> Welded flanges allowed only for an application up to 370 °C in conformance with EN 13480-3:2002, D.4.4.

<sup>e</sup> In case flanges are made by cold forming of a base material e.g. flat product, some mechanical properties, like elongation after fracture (A) and impact energy (KV), will be impaired due to cold forming without subsequently heat treatment.

## 5.2 Repairs by welding

With the exception of weld repairs according to 5.11 repairs by welding are permitted only by written agreement of the purchaser.

Within the certificate for material or component relevant documents shall be noted, that approved welding procedure and welders qualification (see 5.11) have been applied.

## 5.3 Bolting

Flanges shall be suitable for use with the number and size of bolting as specified in Table 10 to Table 21. The bolting shall be chosen by the equipment manufacturer according to the pressure, temperature, flange material and gasket so that the flanged joint remains tight under the expected operating

conditions. For selection of bolting, see EN 1515-4, for combination of the materials of flanges and bolting see EN 1515-2, for information.

## 5.4 Gaskets

The various gasket types, dimensions, design characteristics and materials used are not within the scope of this European Standard. Dimensions of gaskets are given in the EN 1514 series.

## 5.5 Determination of p/T ratings

p/T ratings for flanges according to this standard shall be calculated in accordance with the rules given in Annex F.

p/T ratings for a selection of EN materials are given in Annex G.

## 5.6 Dimensions

### 5.6.1 Flanges and collars

The dimensions of flanges and collars shall be as given in Table 8 and Table 10 to Table 22 according to the PN designation. Dimension  $G_{\max}$  may be varied from the given value (see NOTE 1) which is a maximum limit. The wall thickness,  $S$  is a minimum value, selected according to pipe thickness  $T$  given in ISO 4200 (see NOTE 2). Outside diameter of neck (A) is selected according to EN 10220. The reduced wall thickness  $S_p$  is used in case of unequal  $S$  and  $T$  (type 34 see Table 12 to Table 15 and Annex A).

The following flange types have been re-calculated according to the calculation method in EN 1591-1 with the basic rules as described in Annex E of this European Standard:

- flanges type 11 for PN 2,5 to PN 400. Types 12 and 13 have been adjusted to the results for Type 11. As a result the thickness of some flanges above DN 500 had to be increased and the wall thickness had to be adjusted;
- flanges type 05;
- flanges type 01;
- flanges type 02 with 32 resp. 33 up to DN 600 for PN 2,5 to PN 40;
- flanges types 35 for PN 2,5 to PN 40;
- flanges types 36 and 37 for PN 2,5 to PN 16;
- types 21 and 04 with 34 have not been re-calculated according to EN 1591-1.

NOTE 1 The centre portion of the face of a flange type 05 need not be machined provided that the diameter of the un-machined portion does not exceed the recommended diameter for  $G_{\max}$ , given in Tables 10 to 21.

NOTE 2 When requested by the pressure equipment manufacturer/purchaser, wall thickness components/parts  $S$ , other than those given in this European Standard, can be supplied by agreement with the flange manufacturer, provided a calculation exists.

NOTE 3 A summary of the various types of flanges specified is given in Table 7 showing the nominal sizes applicable to each type and to each PN.

NOTE 4 Diameters  $N_1$ ,  $N_2$  and  $N_3$  of flange and collar types 11, 12, 13, 21 and 34 are the theoretical values permitting the use of ring spanners or the application of normal series plain washers without any additional machining, e.g. spot facing (see 5.8).

NOTE 5 The bore diameters of flanges type 21 are not specified in this standard, the effective bore diameters are usually given in the relevant component standard(s).

NOTE 6 Approximate masses of flanges and collars are given in Annex C.

NOTE 7 For the dimension of wall thickness  $S$  and beveled wall thickness  $S_p$ , see Annex A. For flange type 34, refer to Tables 12 to 15.

### 5.6.2 Hubs

The hubs of flange types 12, 13 and 34 shall be either:

- a) parallel, or
- b) for manufacturing purposes, taper with an angle not exceeding  $7^\circ$  on the outside surface for forging or casting purposes.

Details of the weld end preparation for flanges type 11 and collar types 34 to 37 shall be as given in Annex A.

### 5.6.3 Threaded flanges

**5.6.3.1** The threads of flanges type 13 shall be parallel (symbol  $R_p$ ) or tapered (symbol  $R_c$ ) in accordance with ISO 7-1. Gauging shall be in accordance with EN 10226-3.

NOTE Parallel threads will be supplied unless otherwise requested by the purchaser.

**5.6.3.2** The thread shall be concentric with the axis of the flange and misalignments shall not exceed 5 mm per metre.

Flanges type 13 shall be manufactured without a parallel counterbore, but to protect the thread they shall be chamfered to the major diameter of the thread at the hubbed side of the flange at an angle between  $30^\circ$  and  $50^\circ$  to the axis of the thread. The chamfer shall be concentric with the thread and shall be included in the measurement of the thread length provided that the chamfer does not exceed one pitch in length.

### 5.6.4 Bolt holes

Bolt holes shall be equally spaced on the pitch circle diameter. In the case of flanges type 21 they shall be positioned such that they are symmetrical to the principal axes and such that no holes fall on these axes i.e. positioned "off-centre", see Figures 5 to 16.

### 5.6.5 Lapped joints

The dimensions of lapped joints to be used with flanges, type 02, are specified in Table 8 and Tables 10 to 14.

### 5.6.6 Collar types

The dimensions of collar types 35, 36 and 37 to be used with flanges type 02 are given in Tables 10 to 14. Type 33 thickness shall be at least the same as for type 37.

## 5.7 Facings

### 5.7.1 Types of facings

The types of facings shall be as given in Figure 3 and their dimensions shall be as given in Figure 4 and Table 8.

For facings types B, D, F and G, the transition from the edge of the raised face to the flange shall be:

- a) radius, or
- b) chamfer

at the choice of the flange manufacturer.

## 5.7.2 Jointing face finish

**5.7.2.1** All flange and collar jointing faces, except types 33, 36 and 37, shall be machine finished and shall have a surface finish in accordance with the values given in Table 2 when compared with reference specimens by visual or tactile means.

NOTE It is not intended that instrument measurements be taken on the faces themselves; the  $R_a$  and  $R_z$  values as defined in EN ISO 4287 relate to the reference specimens.

**5.7.2.2** For flanges and collars (except types 33, 36 and 37) with facing types A, B1, E and F, turning shall be carried out with a round nosed tool in accordance with Table 2.

**5.7.2.3** If not otherwise agreed between the purchaser and the supplier type 01 and type 05 up to PN 40 and collars (except types 33, 36 and 37) shall have type A facing, other flanges shall have standard facing type B1 for all PN numbers.

**Table 2 — Surface finish for jointing faces**

<b>Facing types</b>	<b>Method of machining</b>	<b>Radius of round nosed tool</b>	$R_a$ <sup>a</sup>		$R_z$ <sup>a</sup>	
		mm	min.	μm	max.	min.
A, B1 <sup>b</sup> , E, F	Turning <sup>c</sup>	1,0	3,2	12,5	12,5	50
B2 <sup>b</sup> , C, D, G, H	Turning <sup>c</sup>	—	0,8	3,2	3,2	12,5

NOTE For certain applications, e.g. low temperature gases, it can be necessary to stipulate closer control to the surface finish.

<sup>a</sup>  $R_a$  and  $R_z$  are defined in EN ISO 4287.

<sup>b</sup> Types B1 and B2 are raised face (type B) flanges with different specified surface roughness values:  
B1: Standard facing for all PN numbers.

B2: Only if agreed between the purchaser and the flange manufacturer.

<sup>c</sup> The term 'turning' includes any method of machine operation producing either serrated concentric or serrated spiral grooves.

## 5.8 Surface finish of flanges and collars

### 5.8.1 Surface finish

The surface finish of flanges and collars shall be according to Table 3. The given surface roughness values apply to as-delivered condition, unless otherwise specified by the purchaser.

**Table 3 — Surface finish**

Flange type	Outer diameter		Centre bore diameter		Bolt holes	Spot facing
	Ra max µm	Rz max µm	Ra max µm	Rz max µm		
01 (Plate flange for welding)	25	160	25	160	b	c
02 (Loose plate flange for Types 32—37)	25	160	25	160	b	—
04 (Loose plate flange for Type 34)	25	160	25	160	b	—
05 (Blind flange)	25	160	n.a.		b	c
11 (Weld-neck flange)	25 a	160 a	25 a	160 a	b	c
12 (Hubbed slip-on flange for welding)	25 a	160 a	25 a	160 a	b	c
13 (Hubbed threaded flange)	25 a	160 a	See thread standard		b	c
21 (Integral flange)	25 a	160 a	25 a	160 a	—	c
32 (Weld-on plate collar)	25	160	25	160	—	—
33 (Lapped end pipe)	25 a	160	25 a	160	—	—
34 (Weld-neck collar)	25 a	160 a	25 a	160 a	—	—
35 (Welding neck)	25 a	160 a	25 a	160 a	—	—
36 (Pressed collar with long neck)	25 a	160 a	25 a	160 a	—	—
37 (Pressed collar)	25 a	160 a	25 a	160 a	—	—

<sup>a</sup> Or up to PN 40 un-machined.  
<sup>b</sup> Bolt holes > PN 40 only drilled.  
<sup>c</sup> Chip machining spot facing for PN ≥ 63 (see 5.8.2).

### 5.8.2 Spot facing or back facing of flanges

Any spot facing or back facing shall not reduce the flange thickness to less than the flange thickness specified. When spot facing is used, the diameter shall be large enough to accommodate the outside diameter of the equivalent normal series of washers in accordance with EN ISO 887 for the bolt size being fitted. The bearing surfaces for the bolting shall be parallel to the flange face within the limits given in Table 22. When a flange is back faced a minimum fillet radius,  $R_2$  (see Figure 17) in accordance with Table 23 shall be maintained.

### 5.9 Tolerances

Tolerances on dimensions of flanges and collars shall be as given in Table 22.

General tolerances for dimensions without given tolerance: according to EN 22768-1:1993.

## 5.10 Marking

### 5.10.1 General marking requirements

All flanges, lapped ends and collars, other than type 21 flanges, should be marked as follows:

- a) flange/collar manufacturer's name or trade mark, e.g. XXX;
- b) number of this European Standard, i.e. EN 1092-1;
- c) flange/collar type number;
- d) DN, e.g. DN 150;
- e) PN designation, e.g. PN 40 (marking with lower PN numbers, by identical dimensions are possible);
- f) wall thickness ( $S$ ), if not according to this European Standard;
- g) either the name or the number or the grade of the material, e.g. P245GH;
- h) heat number of melt and/or suitable identification, such as code number, for the traceability e.g. A2345, when test certification is required;

EXAMPLE 1 XXX/EN 1092-1/11/DN 150/PN 40/P245GH/A2345;

- i) additional marking (M) for flanges according to Annex I;

EXAMPLE 2 XXX/EN 1092-1/34M/...

If a part is too small to enable all the markings required then the minimum marking required shall be:

- flange/collar manufacturer's name or trade mark;
- letters "EN";
- PN designation, e.g. PN 40;
- either the name or the number or the grade of the material;
- heat number of melt and/or suitable identification, such as code number, for the traceability.

### 5.10.2 Stamping

Marking shall be visible and durable. Where hard stampings are used, the marking shall be positioned on the outer rim of the parts.

It should be ensured that hard stamping markings are not liable to cause cracks in the flange material.

### 5.10.3 Declaration of compliance

The marking EN 1092-1, together with the flange manufacturer's name or trademark on or in relation to a product, represents the flange manufacturer's declaration of compliance to this European Standard, i.e. a claim by or on behalf of the flange manufacturer that the product meets the requirements of this European Standard.

## 5.11 Welding

When producing flanges or collars by fusion welding or flanges or collars formed by bending from sections, bar steel or flat products and flash-butt welded the following criteria are valid:

- welding process/procedures shall be qualified and certified in accordance with EN ISO 15614-1 and EN ISO 15614-13;
- Existing valid welding procedures for arc welding of steels may be used (see EN ISO 15614-1:2017, Introduction);
- welders and/or welding operators shall be qualified in accordance with EN ISO 9606-1:2017 and/or EN ISO 14732.

All welds shall have full penetration.

Local repair of weld seam with filler metal is permitted, provided that the repair procedure/welders are qualified in accordance with the relevant part of the above mentioned standards.

If heat treatment is required, the repair welding shall be carried out prior to that.

## 5.12 Inspection and testing

### 5.12.1 Inspection and testing of fusion welded joints

- a) Welded joints shall be visually examined in accordance with EN ISO 17637 before any other NDT is performed.
- b) The area to be examined shall include the weld metal and the heat affected zones.
- c) The required surface examination shall be performed on all the surfaces.
- d) Any type of non-destructive test (NDT) shall be performed after any forming or heat treatment operation. Where a material is not sensitive to PWHT cracking (e.g. material groups 1.1 and 8.1 (see CEN ISO/TR 15608)), NDT may be performed before PWHT.
- e) In case of austenitic base or filler material, the method for surface testing shall be PT.
- f) Welded pipe as base material shall conform to the relevant product (pipe) standard (see Table 9).
- g) All other longitudinal welds of necks shall have 100 % volumetric (RT/UT) testing.
- h) For type 35 only: Every 10th radial weld of rings shall have 100 % volumetric testing. Every 10th ring weld shall have surface crack detection (MT or PT) except in material groups 1.1, 1.2 or 8.1.
- i) For type 35 only: Welding of neck to ring, every 10th flange shall have surface crack detection of welds (MT or PT).

**Table 4 — NDT methods, techniques, characterization and acceptance criteria for fusion welded flanges or collars**

<b>NDT Methods (abbreviations)</b>	<b>Techniques</b>	<b>Acceptance Criteria</b>
Visual inspection (VT)	EN ISO 17637	EN ISO 5817, surface imperfections, Acceptance level B
Radiography (RT)	EN ISO 17636-1, class B and EN ISO 17636-2, class B	EN ISO 10675-1, Acceptance level 2 and Table 6.6.4-1
Ultrasonic Testing(UT)	EN ISO 17640, min. class B <sup>a</sup>	EN ISO 11666, Acceptance level 2 + no planar imperfections accepted
Penetrant Testing (PT)	EN ISO 3452-1 + test parameter to EN ISO 23277:2015, Table A.1 Acceptance level 1	EN ISO 23277, Acceptance level 1
Magnetic Particle Testing (MT)	EN ISO 17638 + test parameter to EN ISO 23278:2015, Table A.1 Acceptance level 1	EN ISO 23278, Acceptance level 1

<sup>a</sup> Thickness t < 40 mm class A is acceptable. By t > 100 mm class C is required.

NDT operators (Level 1) and supervisor (Level 2) shall be qualified and certified in accordance with EN ISO 9712.

#### **5.12.2 Inspection and testing of bent and electric welded flanges or collars from formed bars, sectional steel or band material**

- a) Welded joints shall be visually examined in accordance with EN ISO 17637 before any other NDT is performed. Acceptance criteria in accordance with EN ISO 5817 surface imperfections level C.
- b) The area to be examined shall include the weld metal and the heat affected zones.
- c) All base material for these flanges, such as plates or flat products shall be inspected ultrasonically according to EN 10160. Scope of test according to EN 10160:1999, Table 3, acceptance criteria Class S<sub>2</sub> and EN 10160:1999, Table 5, Class E<sub>3</sub>.
- d) Flanges made of steels in Material Groups 1E0 and 1E1 (Annexes B and D) and 3E1 shall be subjected by the flange manufacturer to ultrasonic testing or to radiographic testing with reference to Table 5 to the extend defined in Table 5. As a rule, flanges that are produced by continuous welding with the same machine setting are grouped together to form a test batch.
- e) Finished flanges of all other material groups shall be subjected by the flange manufacturer to ultrasonic inspection or to radiographic inspection in the weld zone according to Table 5 on each flange.
- f) Flanges with unit weights > 300 kg shall be inspected ultrasonically or radiographically according to Table 5 in all material groups.
- g) All welds shall be tested by the flange manufacturer for the presence of surface cracks with a suitable method as Penetrant Testing for austenitic base or filler material and Magnetic Particle Testing for Ferritic material according to Table 5. The following materials constitute exceptions: P 235 GH, P 265 GH and P 250 GH.

- h) The non-destructive testing shall be carried out after completion of possible post-weld heat treatment (PWHT). Where a material is not sensitive to PWHT cracking e.g. material groups 1.1 and 8.1 (see CEN ISO/TR 15608), NDT may be performed before PWHT.

**Table 5 — Scope of non-destructive testing for flanges or collars formed by bending and electric welded formed bars, sectional steel or band material**

Number of flanges per test unit	Scope of non-destructive testing	Minimum of
≥ 1 to ≤ 20	100 %	—
> 20 to ≤ 50	50 %	20 flanges
> 50 to ≤ 200	25 %	25 flanges
> 200 to ≤ 1 000	15 %	50 flanges
> 1 000	10 %	150 flanges

### 5.12.3 Inspection and testing of formed parts manufactured from base material other than forgings

#### 5.12.3.1 Non-destructive testing

The testing of formed parts shall include on each component or batch of identical components (dependent on the material and size of flange), if appropriate:

- wall thickness measurements;
- dimensional checks
- hardness tests (e.g. carbon and low alloy steels);
- ultrasonic testing for internal imperfections in longitudinal and transversal direction (e.g. for thickness above 8 mm);
- examination for surface or near surface imperfections (MT or PT).

Material, heat treatment conditions, heat treatment lot, degree of deformation shall be considered in the definition of the batch (see e.g. the EN 10253 series).

#### 5.12.3.2 Destructive testing for heat treated or hot formed components

Testing shall be performed to verify the heat treatment of the formed parts, and shall include the tests required by the base material specification, e.g.:

- tensile test;
- notch impact test;
- micrographs (e.g. 9 % or 12 % Cr steels).

One set of test per cast, wall thickness range and heat treatment lot shall be performed for flanges and collars with  $PN \times DN > 1\,000$  bar and  $DN > 25$ . The tests shall be performed on test pieces from the component itself, or from test pieces placed together with the components in the heat treatment furnaces. The test results shall fulfil the mechanical properties of the material standard.

## 5.12.4 Inspection and testing of close die flanges

### 5.12.4.1 Tests to be carried out

Unless otherwise agreed between the manufacturer and the purchaser close die steel forgings for flanges shall be tested as follows:

a) Mandatory tests to be carried out:

- 1) tensile test at room temperature;
- 2) impact test.

Tests may be carried out on simultaneous heat treated test samples upon agreement.

b) Optional tests:

- 1) product analysis (where specified, including residual element content);
- 2) tensile test at elevated temperatures (verification of one, all, or any combination of  $R_{p0,2}$ ,  $R_{p1,0}$  and  $R_m$  at elevated temperatures, without requirement  $R_{p0,2}$  will be verified);
- 3) additional impact test at different temperatures (detected values are valid for higher temperatures, if the therefore determined nominal values are obtained);
- 4) further additional tests as ultrasonic testing, penetrant testing, magnetic particle inspection, test for resistance to intergranular corrosion.

**NOTE** Additional tests need to be agreed between the manufacturer and the purchaser.

### 5.12.4.2 Test units for mandatory tests

For testing batches, forgings of similar dimensions of the same cast, made by the same forging procedure and of the same heat treatment charge; shall be divided into test units.

The maximum weight of test units shall be:

- 6 000 kg (finished flanges) for non-alloyed steels according to EN 10222-2, steels according to EN 10222-4 and austenitic steels according to EN 10222-5;
- 3 000 kg (finished flanges) for other steels.

The number of test units of batches shall be limited to 4 units.

For each test unit one tensile test at room temperature and one impact test shall be carried out.

### 5.12.4.3 Preparation of samples and test pieces

Samples shall be provided by one of the following methods:

- from additional forgings;
- from separately forged samples; nominally, the samples shall receive the same hot working reduction and shall have the same equivalent diameter;
- from centre section of forgings; the thickness of centre section shall have minimum 75 % of the forging thickness.

For forgings with a thickness of forging  $t \geq 30$  mm the samples shall be taken in a way, that the axis of the test specimen shall be at a distance of  $t/4$  from the heat treated surface (with a minimum of 10 mm and a maximum of 80 mm), and  $t/2$  from the end.

The direction of test specimen shall be tangential. The direction of V-notch of impact test specimen shall be axially.

#### **5.12.4.4 Test methods**

Tensile tests at room temperature shall be carried out in accordance with the requirements of EN ISO 6892-1. The yield strength to be determined shall be the upper yield strength ( $R_{eH}$ ) or if this is not pronounced, the 0,2 % proof strength ( $R_{p0,2}$ ); for austenitic steels in accordance with EN 10222-5 additionally  $R_{p1,0}$ .

The impact test shall be carried out in accordance with EN ISO 148-1 at a temperature of 20 °C (unless otherwise agreed), on V-notched test pieces and by using a 2 mm striker (KV2). The specifications of the individual parts of EN 10222 shall apply.

#### **5.12.4.5 Repeated tests**

Repeated tests shall be carried out in accordance with EN 10021.

#### **5.12.4.6 Repeated heat treatment**

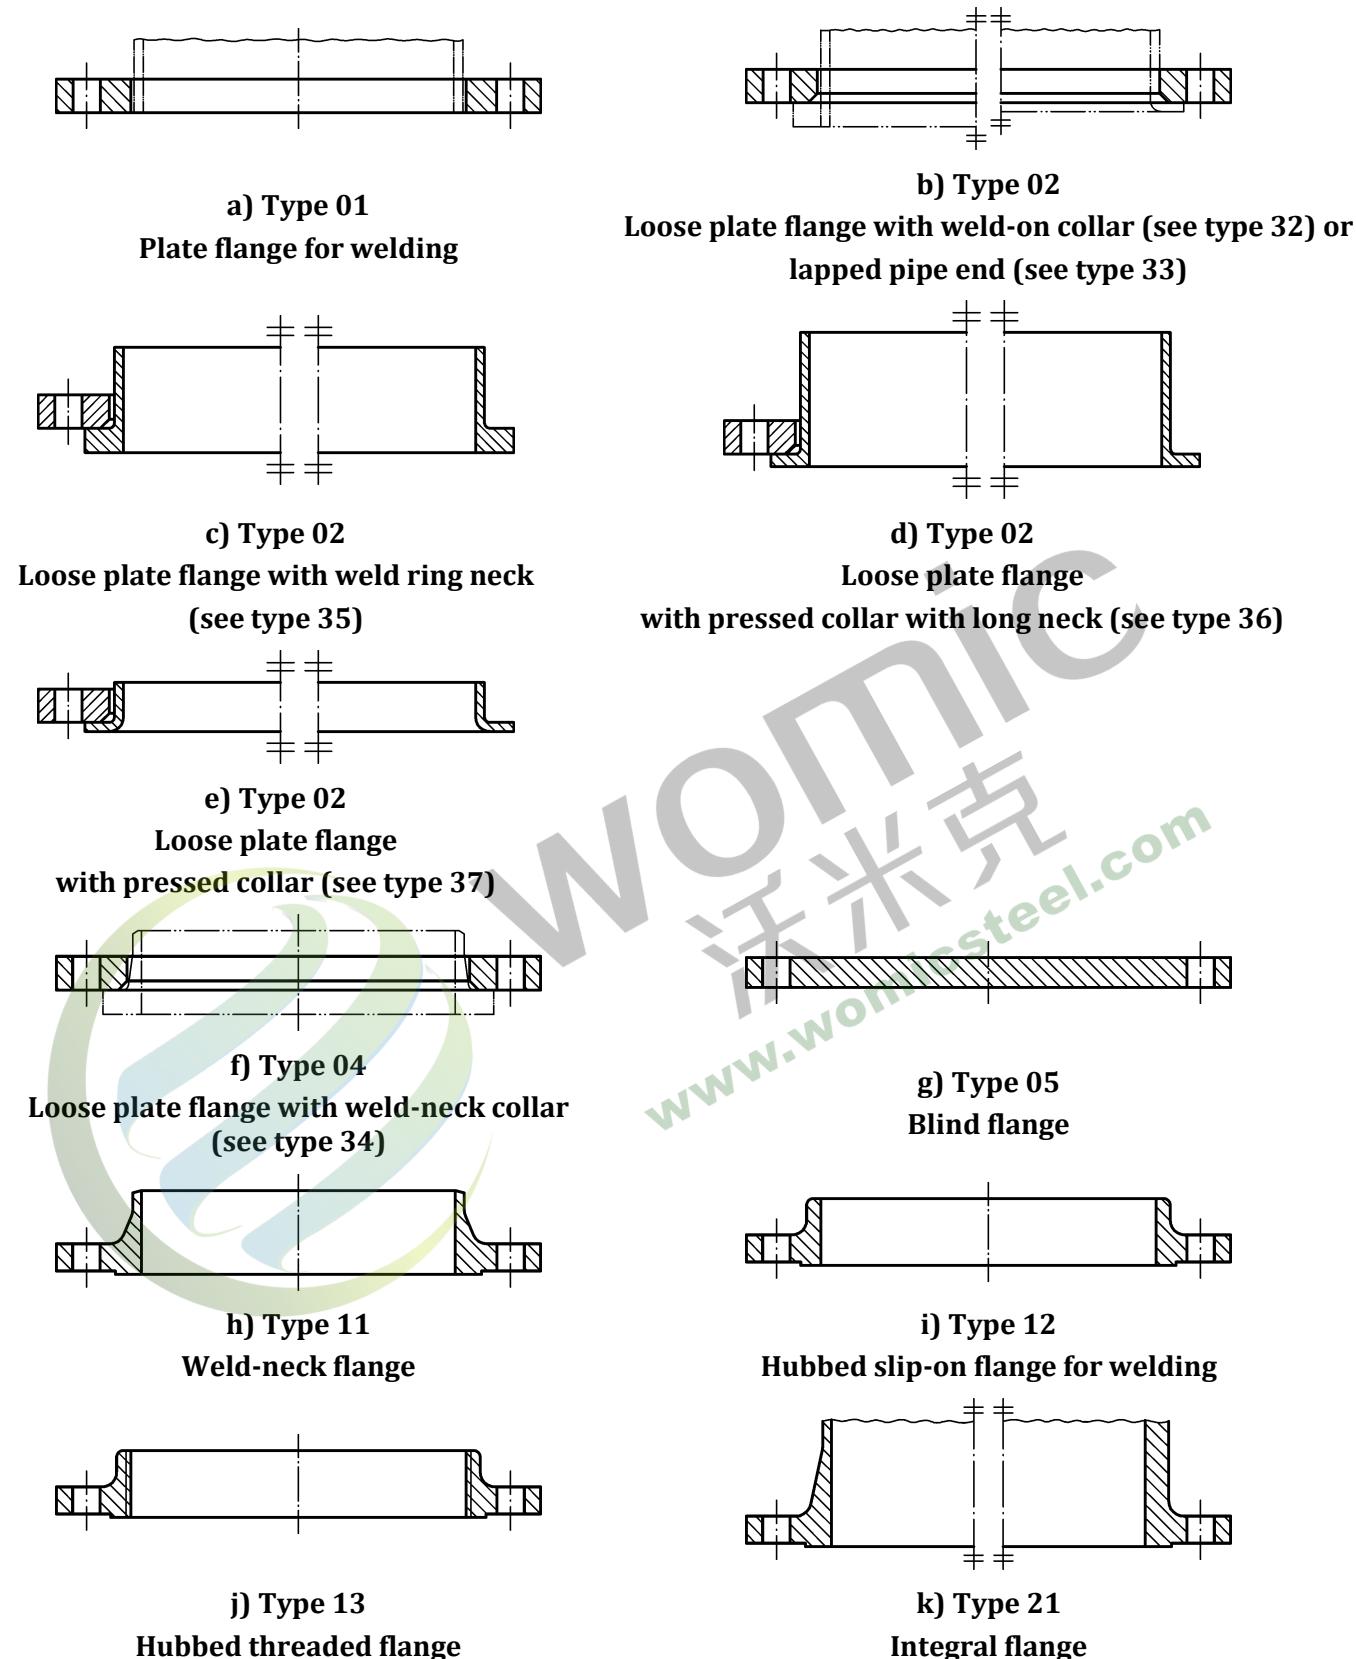

The manufacturer shall have the right to repeat the heat treatment of any material, also for material having not fulfilled the test requirements in a former test, and resubmit it for testing. No forging shall be fully heat treated more than twice.

#### **5.12.5 Inspection and testing of other materials**

Flanges made of forgings; casts, bars, pressed and seamless rolled materials shall be inspected and tested by the material manufacturer in accordance with the appropriate material standard.

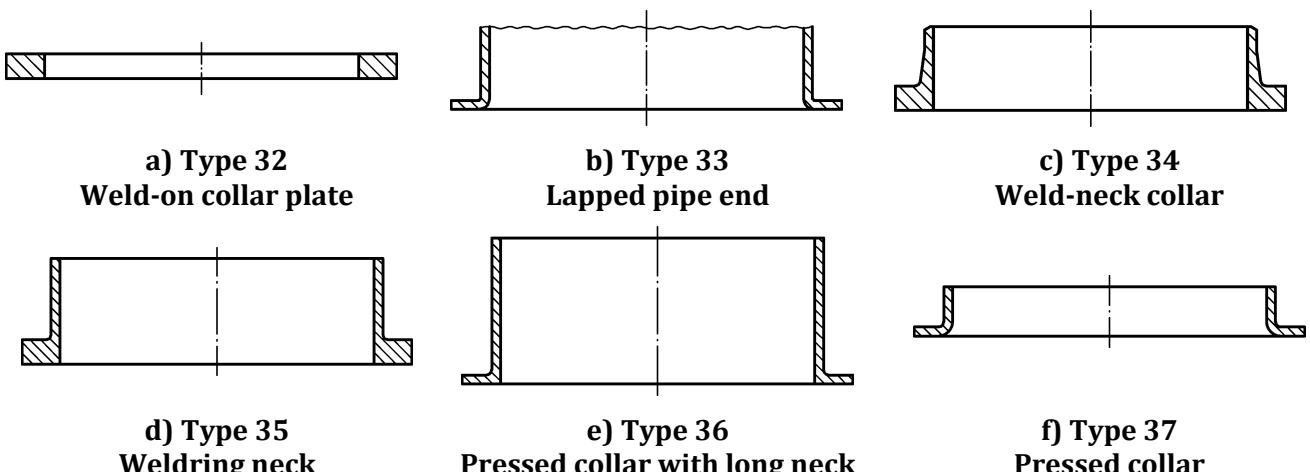

### **5.13 Certificates**

The flange manufacturer shall use respective procedures to ensure traceability of material and to avoid material exchange and shall be able to provide respective documentation for the base material used. Under consideration of EN 764-5, the purchaser of the flange may require a test certificate according to EN 10204 (2.1, 3.1 or 3.2), applicable for the respective category. The rules of pressure equipment European legislation and the product specification, which includes the technical delivery conditions, shall be applied. If an inspection certificate 3.1 is required, the quality system of the material manufacturer shall fulfil the requirements of the European legislation for pressure equipment.

**NOTE** These sketches are diagrammatic only; in particular no detail is shown for the mating surfaces (see Figure 3).

Figure 1 — Flange types

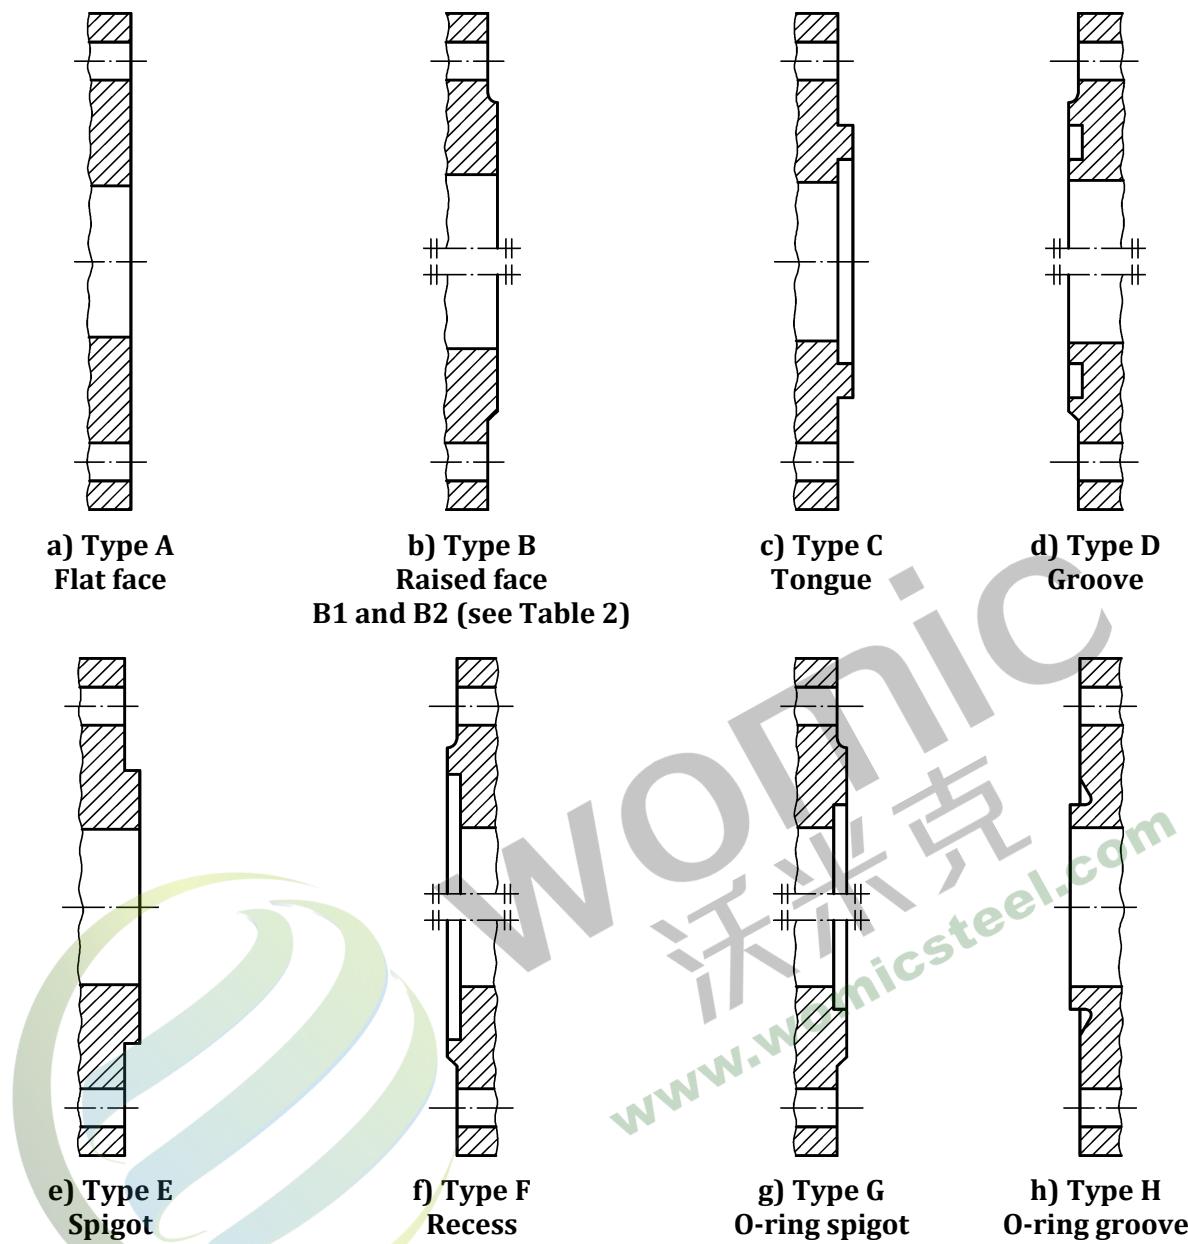

NOTE These sketches are diagrammatic only.

Figure 2 — Collars types 32 to 37

Table 6 — Types of steel flanges and collars

Type No	Description
01	Plate flange for welding
02	Loose plate flange with weld-on plate collar or for lapped pipe end
04	Loose plate flange with weld-neck collar
05	Blind flange
11	Weld-neck flange
12	Hubbed slip-on flange for welding
13	Hubbed threaded flange
21 a	Integral flange
32 b	Weld-on plate collar
33 a, b	Lapped pipe end
34 b	Weld-neck collar
35 b	Weldring neck
36 b	Pressed collar with long neck
37 b	Pressed collar
NOTE Type numbers have been made non-consecutive to permit possible future additions.	
a This is an integral part of a pressure equipment or a component.	
b Type numbers 32, 33, 35, 36 and 37 are for use with type 02 flanges and type number 34 for use with type 04 flanges.	

NOTE 1 The transition from the edge of the raised face to the flange face can be by radius or chamfer for types B, D, F and G only (see 5.7.1).

NOTE 2 B1 and B2 are raised face (type B) for different applications (see 5.7.2.2, 5.7.2.3 and Table 2).

NOTE 3 For the dimensions of flange facings, see Figure 4 and Table 8.

h) Type 11

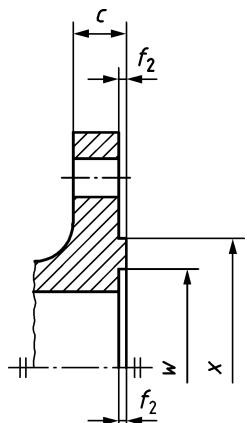

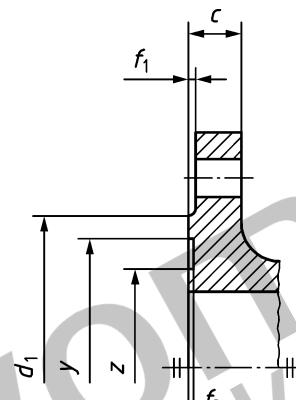

a) Type A: Flat face

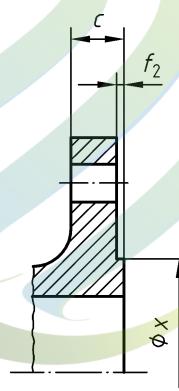

b) Type B: Raised face B1 and B2

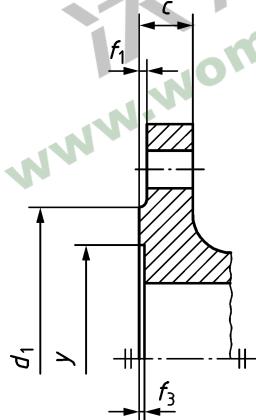

c) Type C: Tongue

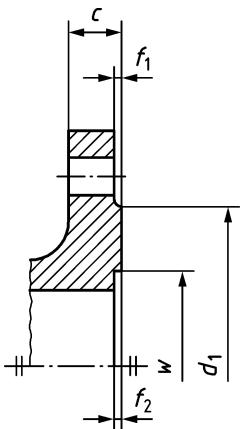

d) Type D: Groove

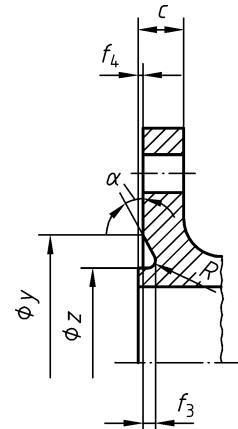

e) Type E: Spigot

f) Type F: Recess

g) Type G: O-ring spigot

h) Type H: O-ring groove

NOTE 1 Dimension  $C$  includes the raised face thickness.

NOTE 2 Cross section diameter of the O-ring is  $2 \times R$ .

a)  
This diagram illustrates the arrangement but not necessarily the correct number of bolt holes. Refer to the column "Bolting Number" in Table 10 for actual number.

b) Type 01  
c) Type 05

d) Type 11

e) Type 02 and 35

g) Type 02 and 37  
37

f) Type 02 and 36

Figure 5 — Dimensions of PN 2,5 flanges

NOTE 1 Dimension  $N_1$  is measured at the intersection of the hub draft angle and the back face of the flange.

NOTE 2 For dimension  $G_{\max}$ , refer to NOTE 1 of 5.6.1.

a To be specified by the purchaser.

b For flanges type 21 the outside hub diameter approximately corresponds to the outside pipe diameter and the nominal value dimensions A, N<sub>3</sub> and R<sub>1</sub> and their tolerances are included for guidance only.

**a)**

This diagram illustrates the arrangement but not necessarily the correct number of bolt holes. Refer to the column "Bolting Number" in Table 11 for the actual number.

**b) Type 01   c) Type 02 and 32   d) Type 02 and 33   e) Type 02 and 35   f) Type 02 and 36   g) Type 02 and 37   h) Type 05   i) Type 11   j) Type 12   k) Type 13****l) Type 21   m) Type 22**

**NOTE 1** Dimensions  $N_1$ ,  $N_2$  and  $N_3$  are measured at the intersection of the hub draft angle and the back face of the flange.

**NOTE 2** For dimension  $d_1$ , see Table 8.

**NOTE 3** For dimensions  $G_{\max}$  refer to NOTE 1 of 5.6.1.

**NOTE 4** Type 33; lapped pipe end without determination of thickness and height.

a For flanges type 21 the outside hub diameter approximately corresponds to the outside pipe diameter and the nominal value dimensions A, N3 and R1 and their tolerances are included for guidance only.

b Only mating dimensions fixed, see Annex J.

This diagram illustrates the arrangement but not necessarily the correct number of bolt holes.  
Refer to the column "Bolting Number" in Table 17 for the actual number.

- NOTE 1 Dimensions  $N_1$ ,  $N_2$  and  $N_3$  are measured at the intersection of the hub draft angle and the back face of the flange.  
NOTE 2 For dimensions  $G_{\max}$  refer to NOTE 1 of 5.6.1.

## Annex A (normative)

### Wall thickness and end preparation for flanges type 11, 34, 35, 36, 37 and pipe nominal thicknesses for the use with type 01 flanges

#### A.1 Weld-end preparation for flanges types 11 and 34

Unless otherwise specified, for flanges in accordance with this European Standard the welding end connections given in Figures A.1 to A.3 shall be used. Additional types of welding ends are specified in EN ISO 9692-2 and examples of designs in EN 1708-1 and may be used by agreement between the component or pressure equipment manufacturer and the flange manufacturer.

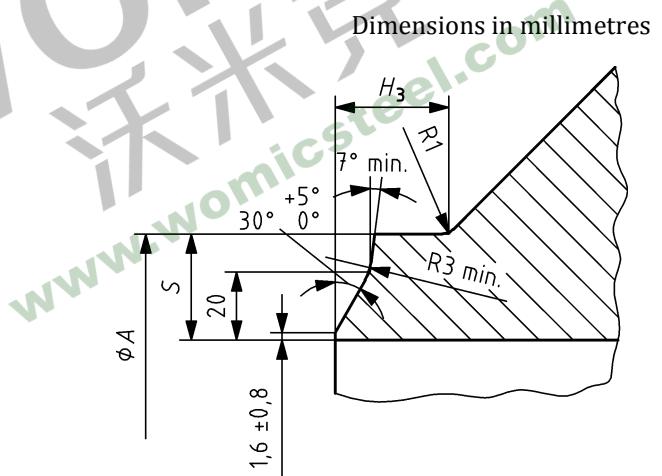

- Wall thickness  $S \leq 3$  mm: Flanges/collars may be delivered with square cut ends.
- Wall thickness  $3 < S < 22$ : Bevelled ends with an angle of  $30^\circ +5^\circ -0^\circ$  and root face of  $(1,6 \pm 0,8)$  mm.
- If flange wall thickness ( $S$ ) > pipe wall thickness ( $T$ ), the inner diameter shall be chamfered with an angle of  $15^\circ +5^\circ -0^\circ$  to match (see Figure A.3).

**Key**

$S$  flange wall thickness

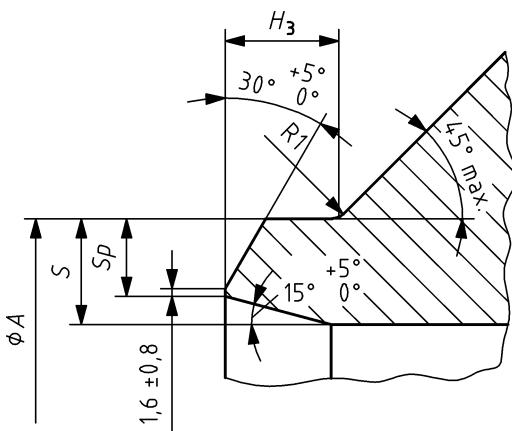

**Figure A.1 — Welding end connection for wall thickness  $S < 22,2$  mm**

**Key**

$S$  flange wall thickness

**Figure A.2 — Welding end connection for wall thickness  $S \geq 22,2$  mm**

**Key**

S flange wall thickness

Sp reduced flange wall thickness

**Figure A.3 — Permissible bevel design for unequal wall thickness**

For flanges required to connect to non-austenitic steel pipe of nominal wall thickness less than 4,8 mm, the welding ends should be finished to a slight chamfer or be square, at the option of the flange manufacturer, if nothing else has been agreed between flange manufacturer and purchaser or pressure equipment manufacturer.

For flanges required to connect to austenitic stainless steel pipe of nominal wall thickness 3,2 mm or less, the welding ends should be square cut ends.

The mating wall thickness of the flange ( $Sp$ ) shall match to the pipe wall thickness ( $T$ ).

## Annex B (informative)

### Material groups

The material groups contain materials of similar chemical/mechanical properties and corrosion resistance in order to facilitate an equivalent application of materials in a group depending on pressure, temperature and fluid.

The material groups 1E0 to 6E1 were part of several national standards of CEN Member nations and can be described as follows:

- 1E0 unalloyed structural steels without guaranteed elevated temperature properties, application range  $-10\text{ }^{\circ}\text{C}$  to  $+100\text{ }^{\circ}\text{C}$ ;
- 1E1 unalloyed structural steels with elevated temperature properties;
- 3E0 unalloyed steels with guaranteed elevated temperature properties;
- 3E1 unalloyed steels with specified properties up to  $400\text{ }^{\circ}\text{C}$ , upper yield strength  $> 265\text{ N/mm}^2$ ;
- 4E0 low alloyed steels with 0,3 % molybdenum;
- 5E0 low alloyed steels with 1 % chromium and 0,5 % molybdenum;
- 6E0 low alloyed steels with 2 % chromium and 1 % molybdenum;
- 6E1 alloy steel with 5 % chromium and 0,5 % molybdenum.

The following groups of materials contain steels with low temperature toughness:

- 7E0 low-temperature-tough fine-grain steel with minimum yield strength of  $275\text{ N/mm}^2$  at room temperature;
- 7E1 low-temperature-tough fine-grain steel with minimum yield strength of  $355\text{ N/mm}^2$  at room temperature;
- 7E2 low-temperature nickel alloyed steel (Nickel  $\leq 3\%$ );
- 7E3 low temperature nickel alloyed steel (Nickel  $> 3\%$ ).

The following groups of materials contain fine-grain steels:

- 8E0 yield strength  $225\text{ N/mm}^2$  min at room temperature;
- 8E2 yield strength  $285\text{ N/mm}^2$  min at room temperature;
- 8E3 yield strength  $355\text{ N/mm}^2$  min at room temperature.

The following groups of materials contain high-temperature-tough ferritic steel:

- 9E0 high-temperature-tough ferritic steel with 12 % chromium, 1 % molybdenum and 0,5 % vanadium;
- 9E1 high-temperature-tough ferritic steel with 9 % chromium, 1 % molybdenum and 0,25 % vanadium and 0,1 % niobium.

The following groups contain stainless austenitic and austenitic ferritic steels, with differences in corrosion resistance, weld ability and strength, Groups 10E0 up to 12E0 are not alloyed with molybdenum, groups 13E0 to 15E0 are alloyed with molybdenum:

- 10E0 LC-steel;
- 10E1 LC-steel, nitrogen-alloyed;
- 11E0 standard carbon-content;
- 12E0 standard carbon-content, stabilized with Ti resp. Nb;
- 13E0 LC-steel with molybdenum;
- 13E1 LC-steel with molybdenum and nitrogen alloyed;
- 14E0 standard carbon-content alloyed with molybdenum;
- 15E0 standard carbon-content, alloyed with molybdenum, stabilized with Ti resp. Nb;
- 16E0 comprise austenitic-ferritic steel.

## Annex C

(informative)

### Approximate masses of flanges and collars

Table C.1 to Table C.12 give calculated masses of flanges and collars, which may be used for guidance only.

These calculated masses are based on nominal dimensions given in Table 10 to Table 21, and on densities of 7,85 g/cm<sup>3</sup> for steel materials.

The actual masses may vary from the calculated masses due to dimensional variations within the permitted tolerances given in Table 22.

**Table C.1 — Masses of flanges PN 2,5**

## Annex D

### (informative)

### Additional materials

Table D.1 lists, in addition to Table 9, materials which are widely in use, but which are not listed in EN standards. These materials do not have any presumption of conformity if used in pressure equipment under jurisdiction of Directive 2014/68/EU (Pressure Equipment Directive). These materials may be used in pressure equipment according to article 4.3 of the PED (sound engineering practice) or in applications that are not covered by the PED. If they are used in pressure equipment according to categories I to IV according to the PED, they shall have either a

- European Approval of Material (EAM), or
- be covered by a Particular Material Appraisal (PMA).

PMA shall be made by the pressure equipment manufacturer and in categories III and IV it shall have appraisal of the notified body that is responsible for the conformity assessment of the equipment. In the PMA it shall be proved, that the material fulfils the essential safety requirements of the PED.

<sup>a</sup> Material for bars in all Groups are identical with the material for forgings, ASME Materials see additionally footnote b.  
<sup>b</sup> The specification of ASME Materials may not be equivalent in all details to the material groups and therefore may not be equally for all applications.  
<sup>c</sup> Starting material for the manufacture of flanges. The properties of the resulting flanges may differ from starting material and require to be taken into consideration, so that the resulting flange has adequate properties.  
<sup>d</sup> Base material see flat steel products.  
<sup>e</sup> Impact properties for RT or low temperature service and guaranteed elevated temperature properties for high temperature service shall be considered.  
<sup>f</sup> Material Data Sheet by VdTÜV.  
<sup>g</sup> These DIN-materials are listed upon EN 10222-4 has been revised and provide the corresponding NL-Grades.  
<sup>h</sup> Use as forging with the requirements for chemical and mechanical properties of EN 10025-2, hot-rolled structural steel.  
<sup>i</sup> Material listed in German National Annex NB of DIN EN 10222-5.

## Annex E (normative)

### Basis of flange calculation

#### **E.1 General**

The calculation of flange union (pair of flanges, bolts and a gasket) according to this standard and the determination of p/T ratings have been carried out as follows.

**NOTE** External loads have been considered and can be adopted according to the following methods of approximation. These are not mathematical formulae for the calculation of accurate values but an interpretation of the possible external loads derived from practical experience. The real external loads in piping can be different to those calculated below.

#### **E.2 Calculation method**

According to EN 1591-1; the correction for EN 13445-3:2014, Annex G has been applied to Formula (A.1).

#### **E.3 Basic rules for calculation of flange connection**

##### **E.3.1 General**

Calculation temperature for all load cases i.e. assembly, testing and operation to determine the standard flange geometries for the different type of flanges is 20 °C.

To ensure that the requirements regarding permissible general membrane stress of the PED are met, flanges have been calculated using the values specified in Annex F, Table F.2.

For nominal design stresses higher than the time-independent design conditions the regulations of the applied design code such as EN 13445 (all parts) or EN 13480 (all parts) need to be considered. In any case attention needs to be paid to the effects of temperature.

External loads have been considered. These external loads are calculated by using the following formulae:

- Flange type 01, type 11, type 04 with type 34:

$$F_{R1} = 15 \cdot \pi \cdot (A \cdot S - S^2) / 1\,000 \quad \text{dimensions } A, S \text{ in mm, } F_{R1} \text{ in kN}$$

$$F_{R2} = \text{Min} (\text{DN}; 10 \cdot \sqrt{\text{DN}}) \quad F_{R2} \text{ in kN}$$

$$F_R = \text{Max} (F_{R1}; F_{R2})$$

- Flange types 32, 35, 36 and 37:

$$F_{R1} = P_N \cdot \pi \cdot (\text{DN}^2) / 40\,000 \quad \text{dimensions in mm, } F_{R1} \text{ in kN}$$

$$F_{R2} = 5 \cdot \sqrt{\text{DN}} \quad F_{R2} \text{ in kN}$$

$$F_R = \text{Min} (F_{R1}; F_{R2})$$

### E.3.2 Flanges

#### E.3.2.1 Flanges type 11, type 04 with type 34, type 05

- a) Flange facing: Raised face.
- b) Height of raised face according to Table 8, depending on DN.
- c) Corrosions allowance (inner surface): 1,0 mm, for carbon steel, 0,0 mm for stainless steel.
- d) Tolerances for flange thickness according to Table 22, for machined on front face only.
- e) Flange material.
- f) Nominal design stress:
  - 1) at operation 140 MPa;
  - 2) at assembly and testing 200 MPa ( $P_{test} = 1,43 \times PN$ ).

NOTE That is close to the values of P245GH (forged steel, normally annealed (NG)) and 1.4404 (forged steel, solution treated (AT)).

- g) E-Modulus: 212 000 MPa;
- h) Mean coefficient of thermal expansion  $\alpha (10^{-6}/K) = 11,9$ .

#### E.3.2.2 Flanges types 35, 36 and 37 with type 02

Material values have been similar according to E.3.2.1, but for austenitic steel:

- a) e-modulus 200 000 MPa;
- b) mean coefficient of thermal expansion  $\alpha (10^{-6}/K) = 15,3$ ;
- c) no corrosion allowance;
- d) flange facing and tolerances according to E.3.2.1.

#### E.3.2.3 Flanges type 01

- a) Material values have been similar according to E.3.2.1.
- b) Pipe nominal thickness has been chosen either according to Table A.1 or to Table A.2.
- c) Corrosion allowance is 1 mm to pipe inner surface.

### E.3.3 Pipes

- a) Dimensional series for the pipe: EN 10216-2, EN 10216-5 and EN 10217-7.
- b) Pipe wall thickness  $T = \text{Mating wall thickness of flange } S_p$ .
- c) Consideration of elasticity of the hub especially for large DN.
- d) Nominal design stress:

- 1) at operation 140 MPa;
- 2) at assembly and testing 200 MPa ( $P_{\text{test}} = 1,43 \times PN$ ).
- e) E-modulus: 212 000 MPa for Carbon steel and 200 000 MPa for Austenitic steel.
- f) Mean coefficient of thermal expansion  $\alpha (10^{-6}/K) = 11,9$  (CS) and 15,3 (AS).

NOTE The values indicated above are close to those given for P235GH respectively X2CrNiMo17-12-2.

#### **E.3.4 Bolting/Tightening**

- a) Bolts: Fully threaded screw (Hexagon head bolt) according to EN ISO 4014 with one nut, smooth and lubricated friction coefficient 0,2.
- b) Bolt material:
  - 1)  $\leq M39$ : nominal design stress at operation 200 MPa, at assembly and testing 285,7 MPa;
 

NOTE 1 That is close to the values of 5.6-bolt.

2)  $> M39$ : nominal design stress at operation 250 MPa, at assembly and testing 419 MPa.

NOTE 2 That is close to the values of 25CrMo4.
- c) E-modulus: 212 000 MPa.
- d) Wrenching up to and including M20, torque wrench above M20.
- e) Scatter value according to EN 1591-1:2013, Annex C, for one single bolt max M20:  $+/- 0,4$  and for bolts larger than M20:  $\pm 0,2$ .
- f) Allowed slope of flange plate:  $1,0^\circ$ .
- g) Bolting strength category according to EN 1515-2: medium strength.
- h) Minimum bolt pre-tension rate: Minimum load ratio 0,3.
- i) Number of assemblies/re-assemblies during lifetime: 20.
- j) Integral coefficient of thermal expansion  $\alpha (10^{-6}/K) = 11,9$ .

#### **E.3.5 Gasket**

- a) Up to and incl. PN 63: Non-metallic flat gasket, larger DN of PN 63 and higher PN: Spiral wound gasket.

b) Gasket dimensions and factors:

	Non-metallic flat gasket	Spiral wound gasket
Dimensions	EN 1514-1	EN 1514-2 <sup>1)</sup>
Thickness	$\leq DN\ 300: = 2\ mm$ $> DN\ 300: = 3\ mm$	$= 4,5\ mm$
$Q_{min}$	$= 25\ MPa$	$= 50\ MPa$
$Q_{max}$	$= 100\ MPa$	$= 300\ MPa$
$E_0$	$= 8\ 000\ MPa$	$= 10\ 000\ MPa$
$K_1$	$= 20$	$= 20$
$c_1$	$= 0$	$= 0$
$g_c$	$= 0,9$	$= 0,9$
$QI/P\ (m)$	$= 1,6$	$= 1,6$

The  $Q_{min}$  /  $Q_{max}$  values have only been fixed for the geometrical calculation of the flanges; other values may be used.

NOTE Leakage classes are not considered.

Womic  
沃米克  
[www.womicsteel.com](http://www.womicsteel.com)

1) Dimensions of spiral wound gaskets for flanges type 11 larger than PN 160: similar to EN 1514-2.

## Annex F (normative)

### Determination of p/T ratings

#### F.1 General

##### F.1.1 Reference temperature (RT)

A maximum allowable pressure related to the PN number (see 3.2) given in this standard is applicable at the Reference Temperature (RT).

RT is defined as the temperature range from  $-10\text{ }^{\circ}\text{C}$  up to and including  $50\text{ }^{\circ}\text{C}$ .

Up to and including  $50\text{ }^{\circ}\text{C}$  all flange types are suitable for the given PN. The flanges may be used for temperatures above  $50\text{ }^{\circ}\text{C}$ . For this higher temperature the p/T rating needs to be calculated.

Down to and including  $-10\text{ }^{\circ}\text{C}$  all materials listed in Table 9 are suitable for a maximum allowable pressure related to the PN number without any further testing than the testing specified in the EN material standard. The materials may be used for lower temperatures. Considerations for prevention of low temperature brittle fracture may be necessary depending on the temperature, the material and heat treatment condition.

**NOTE** The EN product standards (e.g. EN 13445 (all parts), EN 13480 (all parts), EN 13458 (all parts)) specify guidance regarding the prevention of low temperature brittle fracture.

##### F.1.2 Application limits and formulae

For flanges designated in accordance with 4.2 of this European Standard, the maximum allowable pressure PS calculated at temperature shall not exceed a maximum allowable pressure related to the PN number.

$$\text{PS} \leq \text{PN} \quad (\text{F.1})$$

**NOTE** The application for  $\text{PS} > \text{PN}$  requires particular assessment.

## F.2 Symbols, descriptions and units

### F.2.1 General

For this annex the following symbols are used (see EN 13480-3 for further definition).

**Table F.1 — Additional symbols for the application of this annex**

Symbols	Description	Unit
$f_t$	Nominal design stress at temperature	MPa (N/mm <sup>2</sup> )
$f_{CR}$	Nominal design stress at the creep range	MPa (N/mm <sup>2</sup> )
$S_{R Tt}$	Mean value of creep rupture strength	MPa (N/mm <sup>2</sup> )
$SF_{CR}$	Safety factor which depends on time	-
$v_R$	Reference value for thickness	mm

## F.2.2 p/T ratings for materials with time independent nominal design stress

The maximum allowable pressure at temperature is depending on the nominal design stress at temperature in relation to 140 MPa and shall be:

$$PS = PN \times f_t / 140 \text{ MPa} \quad (\text{F.2})$$

The nominal design stress  $f_t$  shall be determined in accordance with Table F.2 taking into account the actual value for  $v_R$ .

## F.2.3 p/T ratings for materials with time dependent nominal design stress

The maximum allowable pressure at temperature is depending on the lower value of the nominal design stress at temperature and the nominal design stress at creep range in relation to 140 MPa and shall be:

$$PS = PN \times \min(f_t; f_{CR}) / 140 \text{ MPa} \quad (\text{F.3})$$

The nominal design stresses  $f_t$  and  $f_{CR}$  shall be determined in accordance with Table F.2 and Table F.3 taking into account the actual value for  $v_R$ .

## F.2.4 Reference value for thickness ( $v_R$ )

EN material standards are specifying strength values depending on different ranges of product thicknesses. The thickness related material values shall be used in calculation.

$v_R$  shall be the upper thickness of each nominal thickness range for which a material strength value ( $R_{eH}$ ,  $R_p$ ,  $R_m$  as appropriate) is given in the material standard. The calculation results of Formulae (F.2) and (F.3) shall be valid for all flanges of this European Standard provided the flanges are made of material with the same or higher material values as the values used for the calculation.

For material with different  $v_R$ , the p/T rating can be given for each  $v_R$ .

**NOTE** The p/T ratings are built by a comparison of a material related term ( $f_t$ ;  $f_{CR}$ ) and the value of 140 MPa to  $PN$ .  $f_t$ ;  $f_{CR}$  are a function of the material thickness for a given material. To compare the results of Formulae (F.2) and (F.3) with the thickness of a flange according to this European Standard,  $v_R$  is introduced in this European Standard.

It is the intention of this annex to provide rules for determination of p/T ratings on a simplified procedure. But it should also be possible to use comparable higher mechanical properties for different thicknesses of base material if this covers the majority of flanges in use.

## F.2.5 Nominal design stresses and safety factors for mean creep rupture strength

The nominal design stresses shall be based on strength values specified in the material standard. The nominal design stresses shall be calculated as shown in Table F.2. Guidance on safety factors as a function of mean creep rupture strength related to time is given in Table F.3.

Linear interpolation of strength values between two adjacent temperature values shall be applied for temperatures above 50 °C (e.g. for 80 °C between 20 °C and 100 °C; for 120 °C between 100 °C and 150 °C).

**Table F.2 — Nominal design stresses**

<b>Material group</b>	<b>Nominal design stress at Temperature / Nominal design stress at the creep range</b>
3E0 to 9E1 and 16E0	$f = \min ((R_{eH\ t} / 1,5 \text{ or } R_{p0,2\ t} / 1,5; R_m / 2,4); S_{R\ Tt} / SF_{CR})$
10E0 to 15E0 (for $30 \leq A \leq 35\%$ ) <sup>a</sup>	$f = \min ((R_{p1,0\ t} / 1,5; R_m / 2,4); S_{R\ Tt} / SF_{CR})$
10E0 to 15E0 (for A above 35 %) <sup>a</sup>	$f = \min ((R_{p1,0\ t} / 1,5) \text{ or } \min(R_{p1,0\ t} / 1,2; R_{mt} / 3)^b; S_{R\ Tt} / SF_{CR}))$
3E0 to 4E0, 7E0, 7E1 (castings)	$f = \min (R_{p0,2\ t} / 1,9)$
5E0, 6E0, 9E0 (castings)	$f = \min (R_m / 3,0)$
10E0 to 15E0 (castings)	$f = \min (R_{p1,0\ t} / 1,9)$

<sup>a</sup> A = Elongation after rupture  
<sup>b</sup> If  $R_{mt}$  is available

**Table F.3 — Safety factors for mean creep rupture strength**

<b>Time T in h</b>	<b>Safety factor <math>SF_{CR}</math></b>
200 000	1,25
150 000	1,35
100 000	1,5

NOTE Data of both tables are derived from EN 13480-3. See EN 13480-3 for further definition.

## F.2.6 Flanges made from steel castings

For flanges made from steel casting (types no. 21, 34) the current dimension needs to be calculated.

The calculation shall be done if a steel flange is combined with a casted flange/valve. p/T ratings are not available for these combinations.

## F.2.7 Rounding of maximum allowable pressure at temperature

The results of calculated maximum allowable pressure PS at temperature (according to Formula (F.2) respectively (F.3)) shall be rounded downwards to the first decimal place (e.g. value of 15,09 bar rounded downwards to 15,0 bar; or 15,19 bar rounded downwards to 15,1 bar).

## Annex G (normative)

### **p/T ratings for a selection of EN materials**

#### **G.1 General**

##### **G.1.1 p/T ratings**

A range of p/T ratings for a selection of commonly used EN materials is indicated in this annex. These p/T ratings are prepared to support the user of this European Standard and shall not be understood either as a limitation in p/T ratings nor materials. If the user of this European Standard has the need to determine his own p/T rating for a certain application this can be done under consideration of the basic rules to determine a p/T rating (see Annex F).

##### **G.1.2 Basics of determination of p/T ratings (see Annex F)**

p/T ratings are calculated by using Formulae (F.2) and (F.3).

In compliance with Formula (F.3), the calculated pressure values do not exceed PN.

Strength values for steel forgings, flat steel products and steel castings are taken from EN material standards considering the different range of product thickness. For provisions regarding the reference value for thickness  $v_R$  see F.2.4.

p/T ratings are calculated by using the strength values of steel forgings depending on different range of product thickness and are verified for flat steel products of the same group.

Nominal design stresses are calculated by using the formulae as defined in Table F.2.

Interpolation rules as defined in Annex F have been applied.

At higher temperatures the additional external loads shall be reduced to the same degree as the maximum allowable pressure.

NOTE 1 The graduation of  $v_R$  depends from the product of material from which a flange is manufactured. For the different methods of fabrication see Table 1 of this European Standard.

NOTE 2 For flanges made from steel casting (type 21) see Table 6, footnote <sup>a</sup> and definitions stated in F.2.6.

NOTE 3 If the flange joint consists of materials with different strength properties (excluding bolts), p/T ratings need to be chosen in accordance with the lowest strength values.

NOTE 4 The p/T ratings are built by a comparison of a material related term ( $f_t/f_{CR}$ ) and the value of 140 MPa to PN.  $f_t/f_{CR}$  are a function of the material thickness for a given material. To compare the results of Formulae (F.2) and (F.3) with the thickness of a flange of this European Standard  $v_R$  is introduced in this European Standard.

##### **G.1.3 Application limits for creep range**

Materials marked with an "X" have been calculated using 100 000 h creep rupture strength values as given in EN material standards under consideration of the safety factor  $SF_{CR}$  as indicated in Table F.3.

The application of creep range within the p/T ratings listed is limited up to and including 600 °C. This limit should be understood as a practical application limit and not as a restriction in use. If there is a need to extend this application limit to higher temperatures than 600 °C this can be done by individual calculations provided mean creep rupture strength values are given in EN material standards.

## G.2 Non-austenitic steels

### G.2.1 General

p/T ratings are given in Tables G.2 to G.13 for non-austenitic steels. They are calculated by using the strength values of steel forgings (see Table G.1) and are verified for flat steel products of the same group (see Table 9) up to and including 600 °C. Thickness related strength values for all thicknesses up to and including 150 mm have been considered, except for material 1.4903 where  $v_R \leq 130$  mm.

p/T ratings are calculated by using the strength values of steel forgings and are verified for flat steel products of the same group (see Notes in Table G.1).

100 000 h creep rupture strength values are considered for materials marked with 'X' in Table G.1.

Maximum allowable pressures at temperatures for which 100 000 h creep have been considered are indicated in italic letters in Tables G.2 to G.13.

For the p/T rating for flanges made from steel castings type 21 (material selection see Table 9) see EN 12516-1. The wall thicknesses need to be verified (see provisions made in F.2.5).

9E1	X10CrMoVNb9-1	1.4903	EN 10222-2	R <sub>p0,2 t</sub>	X	

NOTE The table contains a selection of commonly used non-austenitic materials.

a Refer to Annex D for steel forgings corresponding to this low-temperature-tough fine-grain steel.

b p/T ratings can also be used for material group 7E1 under conditions (see EN 10028-3).

c For all thicknesses of up to and including 70 mm the strength values for temperatures above 50 °C for a thickness range  $35 < v_R \leq 70$  have been used for calculation of p/T ratings.

d For all thicknesses up to and including 150 mm for strength values for temperatures above 50 °C lower strength values either of EN 10028-3 or EN 10222-4 has been used.

e For all thicknesses of up to and including 100 mm the strength values for temperatures above 50 °C for a thickness range  $50 < v_R \leq 100$  have been used for calculation of p/T ratings.

f Material groups 7EO, 7E2; no separate p/T ratings are listed, because of the reason that no strength values for temperatures above 50 °C are given by the related EN standards EN 10222-3 and EN 10028-4.

g No separate p/T ratings are listed, since the strength values are the same as for the NH-grade.

### G.2.3 p/T ratings

## G.3 Austenitic and austenitic-ferritic steels

### G.3.1 General

p/T ratings are given in Tables G.15 to G.26 for austenitic and austenitic-ferritic steels. They are calculated by using the strength values of steel forgings (see Table G.14) and are verified for flat steel products of the same group (see Table 9) up to and incl. 600 °C. Thickness related strength values for all thicknesses up to and including 150 mm have been considered.

p/T ratings are calculated by using the strength values of steel forgings and are verified for flat steel products of the same group.

100 000 h creep rupture strength values are considered for materials marked with 'X' in Table G.14.

Maximum allowable pressures at temperatures for which 100 000 h creep rupture strength values have been considered are indicated in italic letters and shaded in grey in Tables G.15 to G.26.

For flanges made from steel castings (type 21; material selection see Table 9) the p/T ratings shall be the same as for the corresponding steel forgings respectively flat steel products (see Table 9). The wall thicknesses need to be verified (see provisions made in F.2.5).

**NOTE** For nominal design stress values of steel castings it can be necessary to consider the provisions given in applicable component or equipment standards (e.g. EN 12516 (all parts)). For castings made of material 1.4470 according to EN 10213 the allowable temperature is 200 °C.

### G.3.2 List of materials

Table G.14 — Austenitic and austenitic-ferritic materials

Group	Material	Material No.	EN	R <sub>p</sub> / R <sub>e</sub>	Creep	V <sub>R</sub> (mm)	A%

## Annex H

(informative)

### Rings for flanges with groove

The rings should be manufactured from the same material as the flanges they are used with unless otherwise agreed between flange manufacturer and pressure equipment manufacturer.

$R_z = 160 \mu\text{m}$

$R_a = 40 \mu\text{m}$  turned

## Annex I (informative)

### Flanges with fixed inner diameter

#### I.1 General

The Metric pipe standard has a fixed inside diameter (ID), which differs from the EN, DIN and ISO pipe standard that has a fixed outside diameter (OD). Mating dimensions of flanges and collars of the Metric system comply with the other mating dimensions of this standard.

#### I.2 Scope

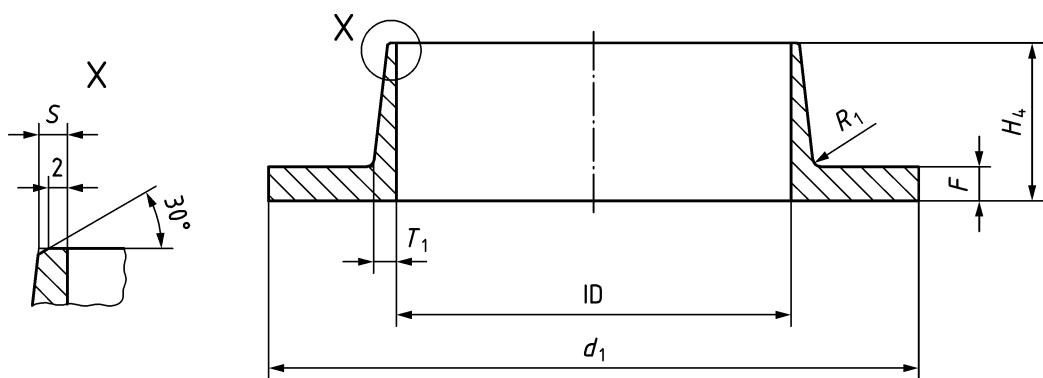

Annex I describes flanges and collars which are commonly used in the metric system and Table I.1 and Table I.2 specify dimensions which differ from, or are missing, in Table 12 to Table 15.

350	3,20	8,00	8,00	68													
400	3,20	8,00	8,00	72													

NOTE Metric types, inside diameter same as DN, missing dimensions as for ISO Types 36 and 37. Loose flanges from Table I.1.

<sup>a</sup> Chamfer A and B as for Types 36 and 37, bevel outside of collar neck.

## Annex J

(informative)

### Mating dimensions for flanges with higher DN

**Table J.1 — Dimensions of PN 25 flanges, symbols (see Figure 9)**

Dimensions in millimetres

DN	Mating dimensions <sup>a</sup>					Outside diameter of neck  A	
	Outside diameter  D	Diameter of bolt circle  K	Diameter of bolt hole  L	Bolting			
	Number	Size					
Flange type					11 21 <sup>b</sup> 35 - 37		
1 200	1 530	1 420	56	32	M52	1 219,0	
1 400	1 755	1 640	62	36	M56	1 422,0	
1 600	1 975	1 860	62	40	M56	1 626,0	
1 800	2 195	2 070	70	44	M64	1 829,0	
2 000	2 425	2 300	70	48	M64	2 032,0	

<sup>a</sup> Further dimensions to be specified by the purchaser.  
<sup>b</sup> For flanges type 21 the outside hub diameter approximately corresponds to the outside pipe diameter.

**Table J.2 — Dimensions of PN 40 flanges, symbols see Figure 10**

Dimensions in millimetres

DN	Mating dimensions <sup>a</sup>					Num ber	
	Outside diameter  D	Diameter of bolt circle  K	Diameter of bolt hole  L	Bolting			
	Number	Size					
Flange type					01, 02, 04, 05, 11, 12, 13, 21		
700	995	900	48	24	M45		
800	1 140	1 030	56	24	M52		
900	1 250	1 140	56	28	M52		
1 000	1 360	1 250	56	28	M52		
1 200	1 575	1 460	62	32	M56		
1 400	1 795	1 680	62	36	M56		
1 600	2 025	1 900	70	40	M64		

<sup>a</sup> Further dimensions to be specified by the purchaser.

**Table J.3 — Dimensions of PN 63 flanges, symbols see Figure 11**

Dimensions in millimetres

DN	Mating dimensions <sup>a</sup>				
	Outside diameter <i>D</i>	Diameter of bolt circle <i>K</i>	Diameter of bolt hole <i>L</i>	Bolting	
				Number	Size
Flange type					
01, 05, 11, 12, 13, 21					
500	800	705	48	20	M45
600	930	820	56	20	M52
700	1 045	935	56	24	M52
800	1 165	1 050	62	24	M56
900	1 285	1 170	62	28	M56
1 000	1 415	1 290	70	28	M64
1 200	1 665	1 530	78	32	M72x6

<sup>a</sup> Further dimensions to be specified by the purchaser.**Table J.4 — Dimensions of PN 100 flanges, symbols see Figure 12**

Dimensions in millimetres

DN	Mating dimensions <sup>a</sup>					Outside diameter of neck <i>A</i>	Bore diameter <i>B</i> <sub>1</sub>		
	Outside diameter <i>D</i>	Diameter of bolt circle <i>K</i>	Diameter of bolt hole <i>L</i>	Bolting					
				Number	Size				
Flange type						01, 05, 11, 12, 13, 21			
						11 21 <sup>b</sup>	01 12		
400	715	620	48	16	M45	406,4	411,0		
500	870	760	56	20	M52	508,0	513,5		

<sup>a</sup> Further dimensions to be specified by the purchaser.<sup>b</sup> For flanges type 21 the outside hub diameter approximately corresponds to the outside pipe diameter.

## Annex ZA

(informative)

### **Relationship between this European Standard and the Essential Requirements of EU Directive 2014/68/EU Pressure Equipment Directive aimed to be covered**

This European Standard has been prepared under a Commission's standardization request M/071 "Mandate to CEN for standardization in the field of Pressure equipment" to provide one voluntary means of conforming to Essential Requirements of the New Approach Pressure Equipment Directive 2014/68/EU.

Once this standard is cited in the Official Journal of the European Union under that Directive, compliance with the normative clauses of this standard given in Table ZA.1 confers, within the limits of the scope of this standard, a presumption of conformity with the corresponding Essential Requirements of that Directive and associated EFTA regulations.

**Table ZA.1 — Correspondence between this European Standard and Annex I of the Directive 2014/68/EU on Pressure Equipment**

Essential Safety Requirements (ERs) of Directive 2014/68/EU on Pressure Equipment, Annex I	Clause(s)/sub-clause(s) of this EN	Remarks/Notes
4.1 a)	5.1.1 and F.1.1	Appropriate materials properties for pressurized parts
3.1.2	5.11	Permanent joining
3.1.3	5.12.1	NDT personnel qualification
3.1.5	5.13	Traceability of component parts materials
2.1, 2.2.1, 2.2.2, 2.2.3 a) and b)	Annex E	Design and calculation for adequate strength
7.1.2	Annex E and F, Table F.2	Permissible general membrane stress

**WARNING 1** — Presumption of conformity stays valid only as long as a reference to this European Standard is maintained in the list published in the Official Journal of the European Union. Users of this standard should consult frequently the latest list published in the Official Journal of the European Union.

**WARNING 2** — Other Union legislation may be applicable to the product(s) falling within the scope of this standard.
